

## Direct Formatting

The font of a paragraph inherits its attributes from the style associated with the paragraph. Within a paragraph, single words can be formatted directly.

### Default

The MigraDoc default font comes from style 'Normal'. It is predefined as Verdana 10pt.

```
\paragraph
{
  Text without any further formatting.
}
```

Text without any further formatting.

### Bold

```
\paragraph
{
  Text with a \bold{bold} word.
}
```

Text with a **bold** word.

### Italic

```
\paragraph
{
  Text with an \italic{italic} word.
}
```

Text with an *italic* word.

### Underline

```
\paragraph
{
  Text with an \underline{underlined} word.
}
```

Text with an underlined word.

### Bold and Italic

```
\paragraph
{
  Text with three \bold{\italic{bold and italic}} words.
}
```

Text with three ***bold and italic*** words.

### Font Color

```
\paragraph
{
  Text with \fontcolor(DarkGreen){dark green}} words.
}
```

Text with **dark green** words.

### Font Size

```
\paragraph
{
  Text with a \fontsize(16){large} word.
}
```

Text with **large** word.

## Font Name

The key words `\bold`, `\italic`, `\fontcolor`, etc. are just short cuts of the general form `\font[...]{...}`. With this notation each attribute of a font can be changed.

```
\paragraph
{
  Text with a \font[Name = "Courier New">{word} in other font.
}
```

Text with a word in other font.

## Superscript and Subscript

```
\paragraph
{
  Text with \font[SuperScript = true]{super script} and
  \font[SubScript = true]{sub script} words.
}
```

Text with <sup>super script</sup> and <sub>sub script</sub> words.

## Underline Color

Except in HTML output, the underline color is given by the current font's color. In HTML, the underline color is determined by the font given directly before the underline keyword was used.

```
\paragraph
{
  Underline uses the \underline{\fontcolor(Red){color} of \fontcolor(Green){the}
  current \fontcolor(Blue){font}}.
}
```

Underline uses the color of the current font.

## Underline Types

Text can be underlined in several manners. Note that the HTML standards specified today do not include different types of underlining.

**Remark:** Style 'Words' is not yet implemented in MigraDoc 1.1.

```
\paragraph
{
  \font[Underline = Single]{Single - All words are underlined.}
  \font[Underline = words]{words - Only words are underlined (nyi).}
  \font[Underline = Dash]{Dash - All words are underlined.}
  \font[Underline = DotDash]{DotDash - All words are underlined.}
  \font[Underline = DotDotDash]{DotDotDash - All words are underlined.}
  \font[Underline = Dotted]{Dotted - All words are underlined.}
}
```

Single - All words are underlined.

Words - Only words are underlined (nyi).

Dash - All words are underlined.

DotDash - All words are underlined.

DotDotDash - All words are underlined.

Dotted - All words are underlined.
